

# Global Warming Warning

*What is it all about? The phrase Global Warming refers to the scientific fact that our climate is getting warmer. Nine of the ten warmest years worldwide on record have occurred since 1994. Scientist has proven that our climate is getting warmer because of “greenhouse gasses.” Which are mainly carbon dioxide, methane, nitrous oxide, water-vapor & ozone. Greenhouse gases trap in the Earth’s atmosphere, causing it to heat like a greenhouse.*

*How do greenhouse gases occur? The scientific community believes that the global climate is warming because of greenhouse gas emissions from human activities, including industrial & manufacturing process, fossil fuel combustion (gas) & changes in our land use, such as deforestation. Shockingly, the USA accounts for twenty five percent of all greenhouse emissions in the world today however, there are other developing industrialized countries such as, China and India rapidly catching up to us compounding the problem of Global Warming.*

*Why is Global Warming a Danger? Global Warming began in the 20<sup>th</sup> century with the turn of the industrial age. The 21<sup>st</sup> century continuation of this warming trend will result in glacier and arctic ice sheet melt down which will cause rising sea-levels to inundate coastal areas wiping out complete Islands causing the migration of multi-millions of refugees as predicted by the year 2010 or more conservatively in our life-time. Cities such as New York, London, Shanghai, Bombay and Japan etc: can expect major flooding. Global Warming also changes weather patterns, increased risks of drought, forest fire, tornadoes, hurricanes, and many health problems. The arctic ice sheet has shrunk twenty percent since 1979. Consider this, while the national hurricane center claims that the increase in hurricane destructiveness since 1995 is due to “Atlantic Ocean Fluctuation” it does not say what was fluctuating. The research shows that it was mainly temperature; hence ocean warming is causing what is acknowledged to be a dramatic increase in hurricane destructiveness. The question then becomes, what caused the ocean warming? All experts acknowledge that, to a significant extent that it is caused by a “multi-decade” natural cycle. However, this cycle alters the ocean temperature only about one degree F, This is about the same amount that Global Warming has occurred as estimated, thus, it must have dramatically affected hurricane intensity. Just think about last year alone of 2005.*

**What is the Kyoto Protocol? The Kyoto Protocol is the first international agreement to fight *Global Warming*. It was signed by 141 nations, including all of Europe and all other Civilly-Developed industrial nations except the *USA and Australia*. The pact went into effect on Feb 16, 05 and expires in the year 2012. The Kyoto Protocol has been celebrated by its backer as a lifeline to save our planet Earth from disastrous human-caused effects of a *warming global climate*.**

**What does the Kyoto Protocol Require? The Protocol sets legally-binding targets for developed countries to reduce greenhouse emissions within 7 years, to about 5% below 1990 levels. To reach this goal, countries must put greenhouse emissions control on its largest polluters, which are corporations and militaries, Productivity will only be maintained if the polluters seek cleaner, renewable alternative Energies to replace fossil fuel (gas energy).**

**General motors' 100% emission free 1996 EV-1 electric auto -- that suddenly disappeared? "Plus Solar, Hydrogen, Hydropower, Biomass, Wind, and Geothermal energy would be excellent renewable alternatives." However, look at how the deceptive *greedy profit of oil* has affected life-style, thus inhibiting the progress of renewable energy alternatives." Vice President Al Gore was a main participant in putting the Kyoto Protocol together in 1997. President Bill Clinton signed the agreement in 1997 but, *the senate refused to ratify it, citing potential damage to the US economy required by compliance*, read the essay's of (*Representation without integrity*) with its counterpart (*Relative points of Interest*), our elected representatives at work!**

**Why did George W. Bush Withdraw US Support? George W. Bush made campaign promises in 2000 to regulate carbon dioxide as a pollutant. However, in 2001, he pulled the US out of the Kyoto accords as one of the first acts of his presidency. Bush dismissed the Kyoto Protocol as too costly, describing it as "an unrealistic and ever-tightening straitjacket." lately, the Whitehouse has even questioned the validity of the science behind *Global Warming*, and claims that millions of jobs will be lost if the US joins this world pact. My personal feelings: after George Bush got reelected, his whole persona of attitude became arrogantly-cocky with little respect for what's really right for the world's best interest. The price at the gas pump is close to tripling since his presidency and why? Read the essay of (*Oh fuck, it's a Duck*) for understand the truth of a *conduced greedy profit for oil, the Fossil Fuel that causes the Carbon Dioxide Emissions -- the main contributor to Global Warming!***
